

Supplementary Figure 5. The regression graphs between the left VLPFC-left hippocampus connectivity and depressive symptoms in the high-PeVA and the low-PeVA group. A: In the high-PeVA group, the ratings of BDI were negatively associated with the connectivity of the left VLPFC-left hippocampus in SWE (B) and NEG (Spearman's $\rho=-0.867$, $p=0.001$ and Spearman's $\rho=-0.610$, $p=0.046$, respectively). 95% of confidence interval is depicted using a dotted line. VLPFC: ventrolateral prefrontal cortex, PeVA: peer verbal abuse, BDI: Beck depression inventory, SWE: swearing, NEG: negative.
